

Transport Infrastructure

This project explains the importance of Breakwater and Intermodal Transportation in the territory of Belgium and the Netherlands. The main importance of breakwaters is to protect the harbour and shore activities.

The main advantage is that they are easy to install, but take time to build. This is why Europe has to make quick decisions to do the work smoothly and efficiently. Europe has to think about making breakwater and quick intermodal transportation structures. Otherwise, Singapore and China will take over the market •
